# USING PYFAI ON SAXS LABORATORY INSTRUMENTS. USE CASE : METROLOGY OF NANOPARTICLES

OLIVIER TACHÉ

## LIONS

*O. Spalla, A. Thill, F. Testard, V. Geertsen,  
D. Carriere, F. Gobeaux, O. Taché*

## LLB (SANS laboratory) :

*A. Brulet, F. Cousin, J. Jestin, A. Cheneviere*

**SWAXS** Lab  
Saclay

DESIGN CEA

**USAXS ultra small angles**

**q range :  $2 \times 10^{-4}$  to  $10^{-1} \text{ \AA}^{-1}$**   
**High resolution**  
 $\lambda = 0.154 \text{ nm}$   
 $E = 8 \text{ keV}$   
 1D detector

**SAXS high brilliance**

**q range :  $7 \times 10^{-3}$  to  $3.5 \times 10^{-1} \text{ \AA}^{-1}$**   
 (fixed configuration)  
 $\lambda = 0.154 \text{ nm}$   $E = 8 \text{ keV}$

**Flux :  $125 \times 10^6 \text{ ph/s}$**   
**Kinetic studies**

**SAXS – WAXS (MOMAC)**

**q range :  $4 \times 10^{-2}$  to  $4 \text{ \AA}^{-1}$**   
 $\lambda = 0.07 \text{ nm}$   **$E = 17 \text{ keV}$**   
**(nanomaterials)**  
**Flux :  $100 \times 10^6 \text{ ph/s}$**

**SAXS / GISAXS**

**q range :  $3 \times 10^{-3}$  to  $5 \times 10^{-1} \text{ \AA}^{-1}$**   
**Polyvalent configuration**  
**Sample under vacuum/air**  
**Big size Pilatus1M Detector**

Flux :  $20 \times 10^6 \text{ ph/s}$

- 150 m<sup>2</sup> dedicated to SAXS:
- 4 experiments
  - Preparation workshop
  - Mini chemistry lab
  - Sample environments
  - Open source software
- Home made and commercial setup
  - Different configurations, different energies
  - Methodology from sample preparation to data treatment (sample thickness, calibration, modelization,...) for size and concentration determination

## SAXS a well known technic

- 30 synchrotron beamlines
- 5 commercial available laboratory intru- (Pananalytical)

## SAXS for Metrology / traceability

Why ? Need of regulation for EU, need of better nanomaterial characterization for industry

- results can be related to a reference through a “documented unbroken chain of calibrations”
- measurement uncertainty
- comparison of measurements to other technics/instruments
- original definition of the unit (SI International System) related to the meter

## Not a direct technic / microscopy

- SAXS is an ensemble technique (like DLS)
- No need of sample preparation
- Scattering sensitive to electron density contrast
- Scattering theory (form factor)
- Interparticle interferences are not negligible

- Size
- Concentration
- Composition
- Electron density
- ...

$$\text{SAXS Intensity} = \text{Form factor} \times \text{Structure}$$

INTERNATIONAL  
STANDARD

ISO  
17867

First edition  
2017-05-01

Particle size analysis — Small-angle  
X-ray scattering

Analyse granulométrique — Diffraction des rayons X aux petits angles

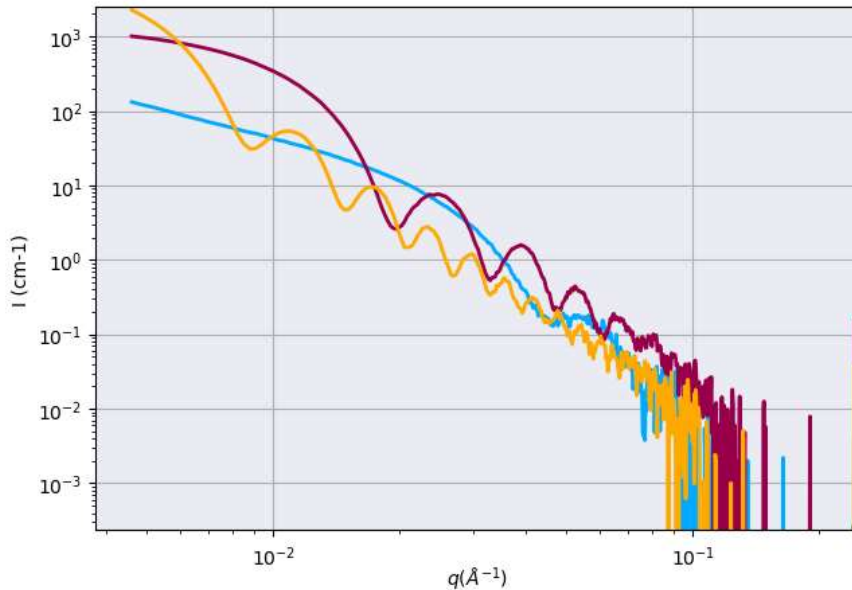

SAXS Intensity = Form factor x Structure

- Size
- Concentration
- Composition
- Electron density
- ...

 Spheric Silica Nanoparticles

19 nm    44 nm    104 nm

*Xeuss instrument 1800s exposure time*

INTERNATIONAL  
STANDARD

ISO  
17867

First edition  
2017-05-01

Particle size analysis — Small-angle  
X-ray scattering

Analyse granulométrique — Diffraction des rayons X aux petits angles

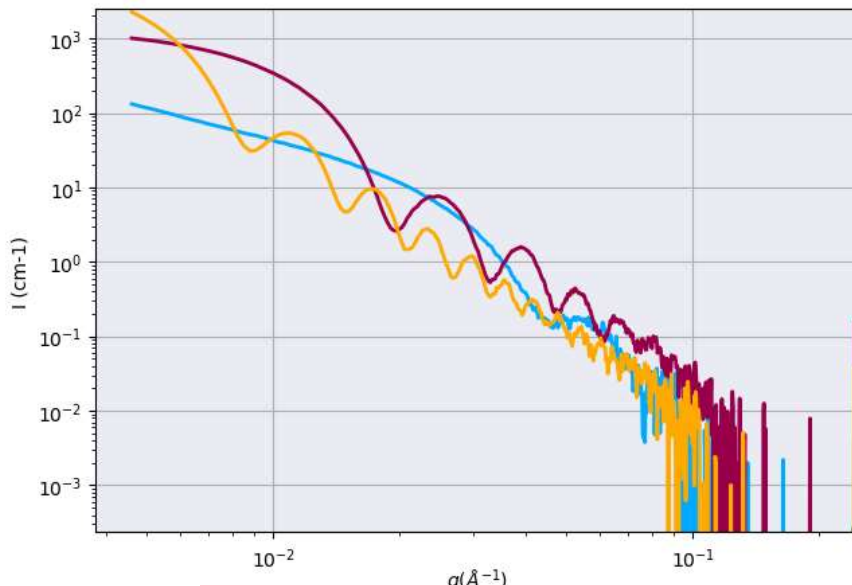

SAXS Intensity = Form factor x Structure

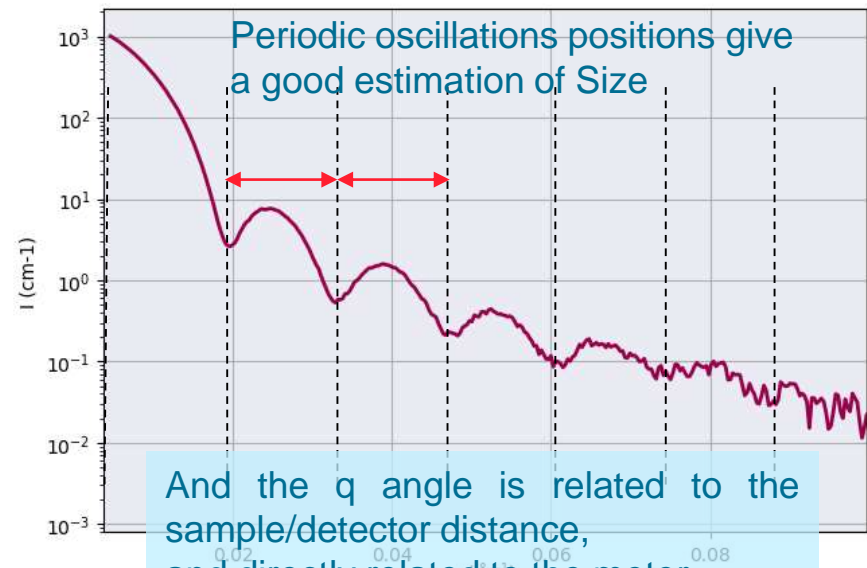

- Size
- Concentration

 Spheric Silica Nanoparticles  
19 nm 44 nm 104 nm

Uncertainty for size is less than 1%

Periodic oscillations positions give  
a good estimation of Size

And the  $q$  angle is related to the  
sample/detector distance,  
and directly related to the meter  
Metrologically traceable

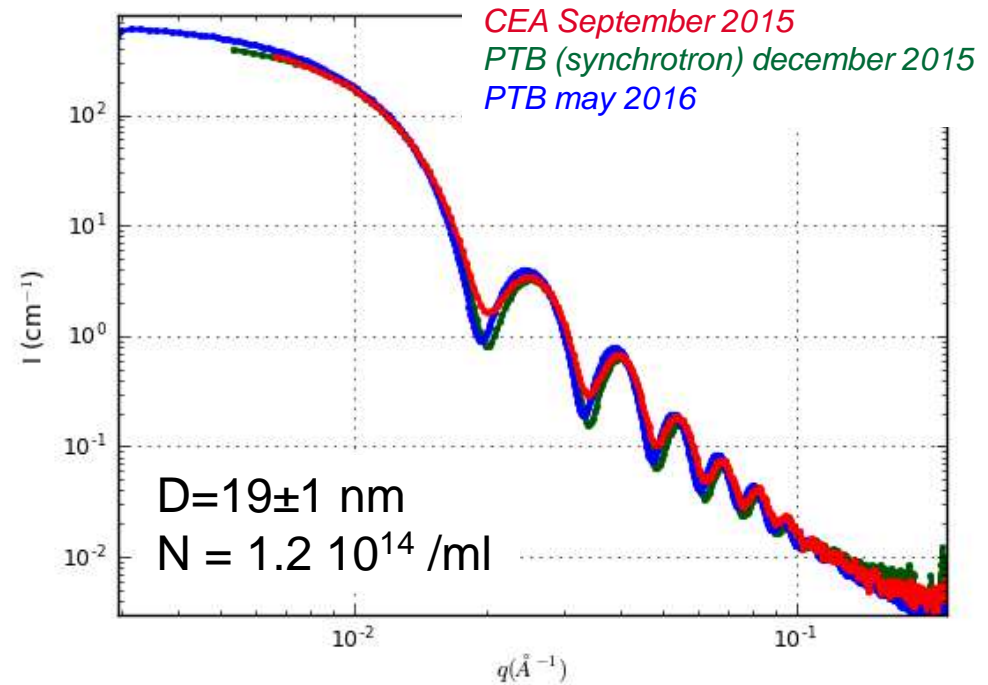

Measurement of nanoparticles concentration

O. Taché, A. Thill, V. Geertsen, E. Barruet, F. Gobeaux

- Synthesis of Monodisperses Spheric Silica nanoparticles (FWHM/diameter mean < 20%) for 5 different sizes
- Monitoring the stability of samples (concentration, size)

19 nm ± 1 nm  
44 nm ± 1.5 nm  
100 nm ± 2 nm

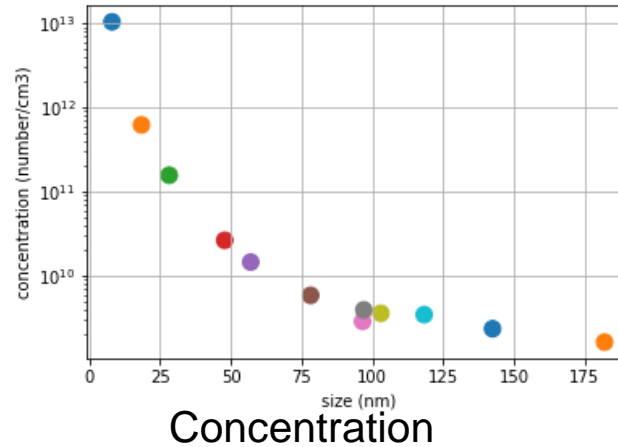

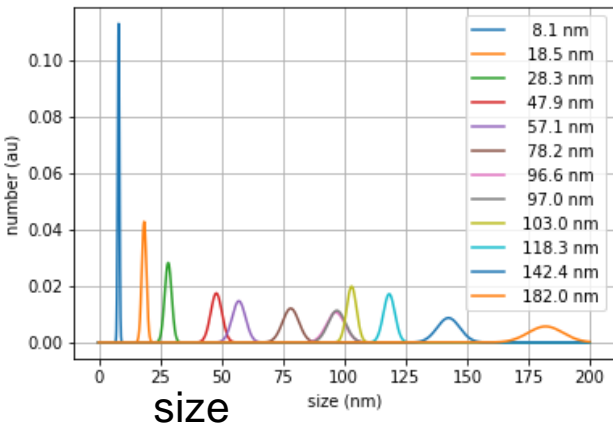

After 30 months of storage :

- Size is constant
- Concentration is relatively stable

Geertsen V., Barruet E., Gobeaux F., Lacour J.L and Taché O.

*Contribution to Accurate Spherical Gold Nanoparticle Size Determination by SPICPMS: A Comparison with SAXS*  
Anal. Chem. 2018, 90, 9742–9750

## Commercials Gold nanoparticles measured by SAXS

## SP-ICPMS measurement (V. Geertsen)

### Single Particle Inductively Coupled Mass Spectrometry (SPICPMS)

- a counting technique
- providing the number of composing atoms of each nanoparticle.
- It is a fast and quantitative technique allowing the measurement of thousands of nanoparticles in a few minutes.
- Assuming nanoparticles shape, it provides number size distribution.

Histogram SAXS  
spICPMS comparison

EMPIR

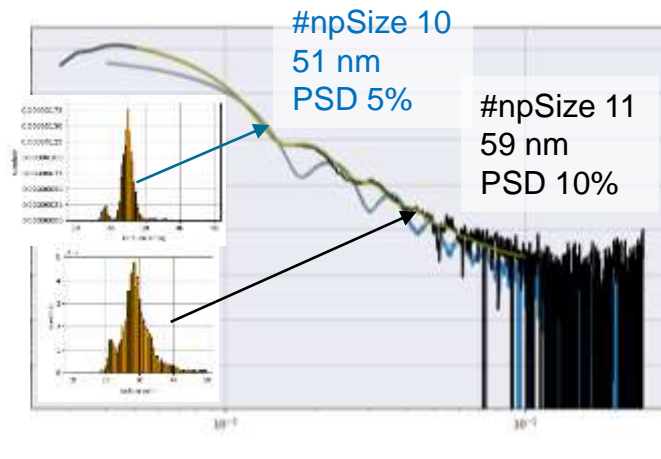

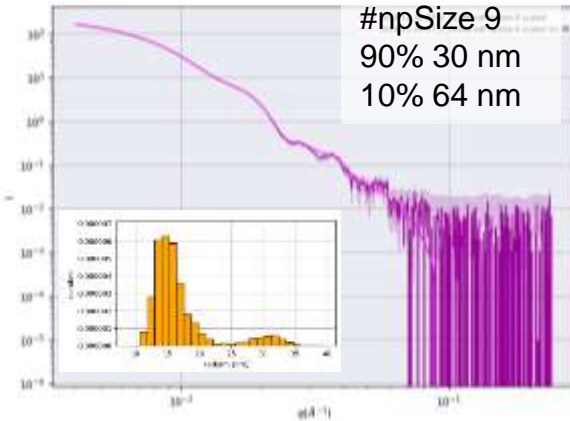

EURAMET

The EMPIR initiative is co-funded by the European Union's Horizon 2020 research and innovation programme and the EMPIR Participating States

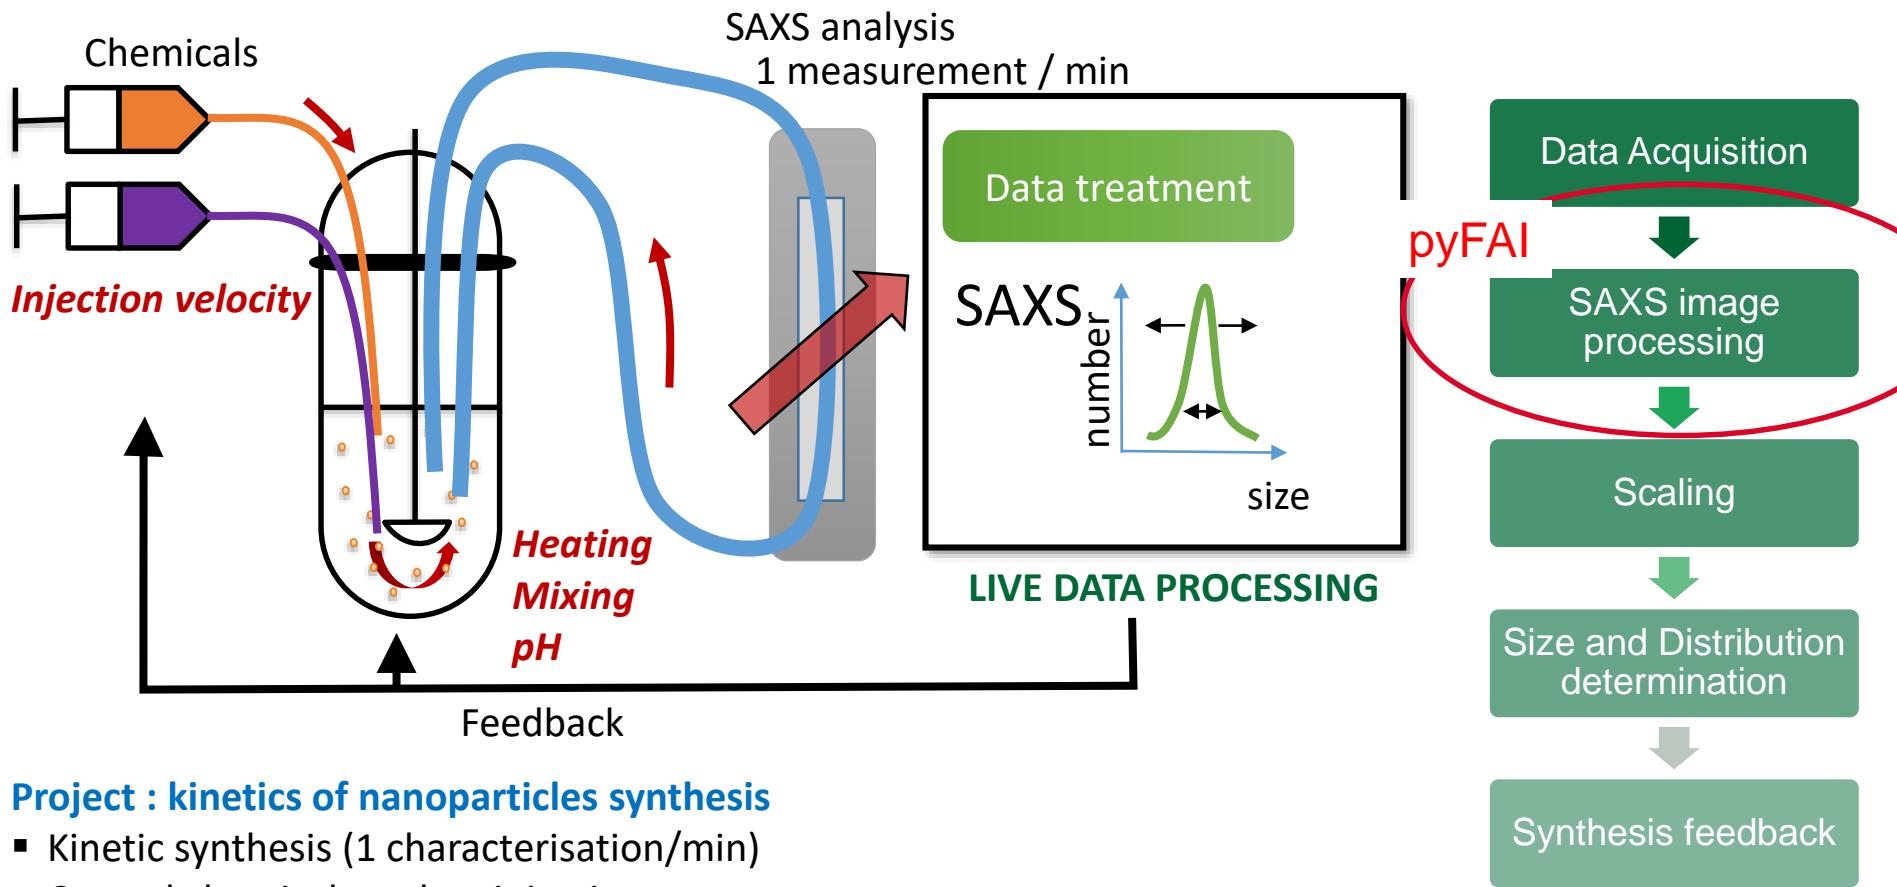

## 2018-2021 European EMPIR Project npSize Improved traceability chain of nanoparticle size measurements

- Nanoparticles as reference material
- International intercomparison / different techniques
- Mixture of spheric silica nanoparticles in suspension synthesized by CEA

Precise control of nanoparticles size during the synthesis

## Project : kinetics of nanoparticles synthesis

- Kinetic synthesis (1 characterisation/min)
- Control chemical product injection
- Control synthesis
- stop injection

« in demand » nanoparticles with sub-nanometric size diameter, concentration, size distribution

# pySAXS, an Open Source Python package and graphic user interface for SAXS data treatment

Series of modules entirely written in Python (2&3) language allowing to process the different operations for the SAXS data treatment.

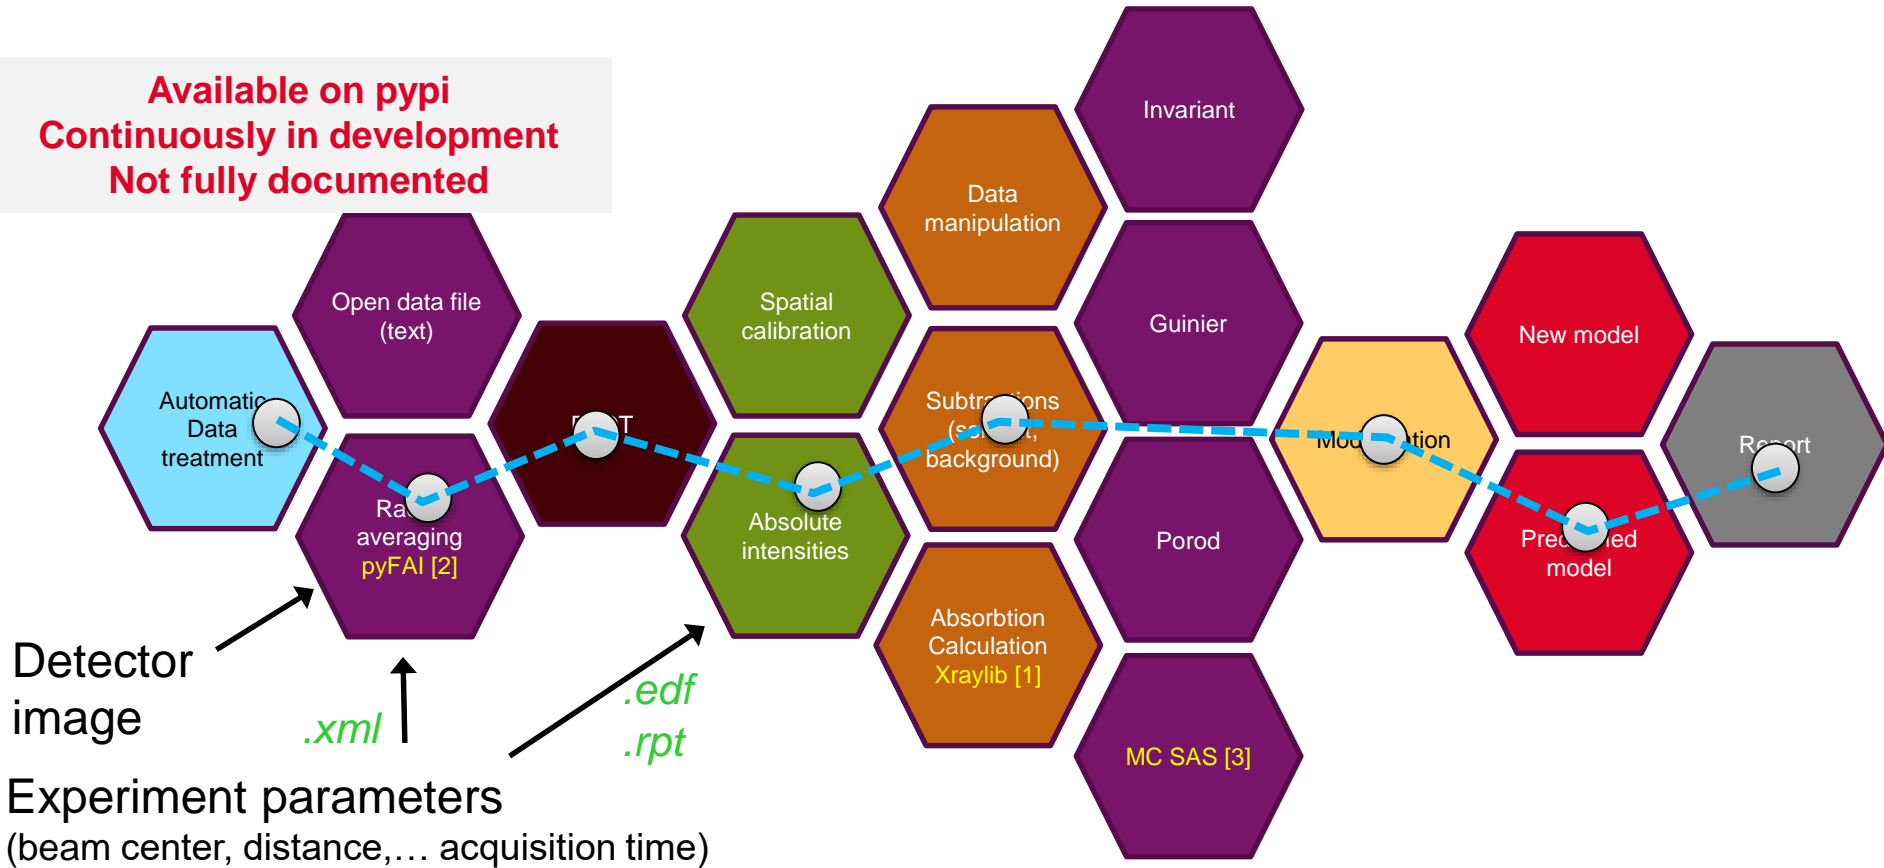

pySAXS is open source and based on Numpy and SciPy libraries, matplotlib, pyQT5

Initially designed for the SAXS experiments (USAXS, SAXS, WAXS), **the package is completely independent from instrument**

pySAXS contains libraries with basic functions for manipulating data (merge, subtract, add,...), setting in absolute scale

**Uncertainties are carefully propagated at each step of data manipulation**

Available on pypi  
Continuously in development  
Not fully documented

## pyFAI need :

- Image mask
- Pixel size
- Detector to sample distance
- Beam position,
- ...

<http://rsbweb.nih.gov/ij>

- Open source
- Very large community

## Plugins for SAXS :

- Beam center and geometry determination
- Mask creation
- Radial averaging
- tools
